12. ☐ Note the attached Information Disclosure Statement(s). (PTO/SB/08 or PTO-1449) Paper No(s) 13. ☐ Other:							
<u>.</u> .							

Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues a lack of motivation to employ the spin temperatures taught by the secondary reference of Blades et al. In response, the Examiner maintains that it appears that the broad range of spin temperatures taught by Blades et al., (e.g., 190-216°C) produces equally suitable plexifilamentary strands. Applicant is invited to factually evidence otherwise.

Applicant further argues that the combination of references is silent with regard to the surface area limitations. Applicant asserts that independent claims 28-30 each contain a limitation directed to the maximum surface area of the fabrics. In response, it is respectfully pointed out that only claim 28 contains a limitation directed to the maximum surface area. It is dependant claims 2 and 3 which contain limitations directed to the maximum surface area. Thus, Applicant's arguments are not considered commensurate in scope. Furthermore, the Examiner maintains that the though the maximum surface area limitation is not taught by the combination of references, it is reasonable to presume that said property will be met by the plexifilamentary film-fibrils of the invention of McGinty et al., in view of Blades et al. Support for said presumption is found in the use of like materials (i.e., polyethylene/normal pentane/cyclopentane) and the use of like processes (flash-spun plexifilamentary filaments at a temperature ranging from 190-216°C), which would result in the claimed property.
